```

3 Data Structures

3.1 unordered_map<clave,valor>

Almacena pares clave valor.

```

// hacer siempre RESERVE
unordered_map<int,int> a;
a.reserve(n*1.33); IMPORTANTEEEEEEE
n = 1e6 aprox 42.6 MB

n = 3e6 aprox 128 MB

```

n = 5e6 aprox 213 MB (aún puede entrar, pero ojo con pila
, I/O buffers, otros contenedores).

3.1.1 Ejemplo basico Contar frecuencias

```

int n;
cin >> n;
vector<int> arr(n);
for (int &x : arr)
    cin >> x;

```

```

unordered_map<int,int> freq; //<clave, valor>
freq.reserve(n*1.33); // evita rehash

for (int x : arr)
    freq[x]++;
for (auto &p : freq)
    cout << p.first << " aparece " << p.second << " veces
        \n";

```

3.1.2 Buscar existencia de una llave

```

unordered_map<string,int> id;
id.reserve(1e5);
id["uva"] = 10;
id["manzana"] = 20;
// Con count
if (id.count("uva")) cout << "uva existe\n";

```

3.1.3 Transformar índices dispersos a continuos

```

vector<int> vals = {1000, 5000, 1000, 42};
unordered_map<int,int> comp;
comp.reserve(vals.size()*1.33);

int id = 0;
for (int v : vals)
    if (!comp.count(v))
        comp[v] = id++;
/*
    Antes -> Ahora
    1000 = 1
    5000 = 2
    42 = 3
*/
for (int v : vals)
    cout << v << " -> " << comp[v] << "\n";

```

3.1.4 Hashing pair

```

struct pair_hash {
    size_t operator()(const pair<int,int>& p) const {
        return ((long long)p.first << 32) ^ p.second;
    }
};

int main()
{
    unordered_map<pair<int,int>, int, pair_hash> edge_cost;
    edge_cost.reserve(1e6);
    //Muy usado para representar grafos dispersos.
    edge_cost[{1,2}] = 5;
    edge_cost[{2,3}] = 10;
}

```

```

    cout << edge_cost[{1,2}] << "\n"; // 5
}

```

3.2 unordered_set<clave>

```

// hacer siempre RESERVE
No existe acceso aleatorio con [] (índices),
pero se puede iterar con for auto.

int n = 3e5;
vi a = {1,2,3,42,42,42};
unordered_set<int> s; //<T>
s.reserve(n * 1.3); // evita rehash

//insert(T)
for (int x : a)
    s.insert(x);

//VERIFICAR EXISTENCIA
if (s.find(42) != s.end())
    cout << "42 existe" << endl;

//Iterar para ver claves existentes
for(auto x : s)
    cout << x << " ";
return 0;

```

9

```

3 -> melon
*/

```

3.3.2 Buscar por clave

```

multimap<int, string> mm;
// insertar pares (clave, valor)
mm.insert({1, "uva"});
mm.insert({2, "manzana"});
mm.insert({2, "pera"});
mm.insert({3, "melon"});

// Buscar la primera aparicion de clave 2
auto it = mm.find(2);
if (it != mm.end())
    cout << "Encontrado: " << it->second << "\n";

// Contar cuantos con clave=2
cout << "Claves con 2: " << mm.count(2) << "\n";
// Obtener todos los con clave=2
auto [ini, fin] = mm.equal_range(2);
for (auto it = ini; it != fin; ++it)
    cout << it->second << " ";
/*
SALIDA
Encontrado: manzana
Claves con 2: 2
manzana pera
*/

```

3.3 unordered_multimap<clave, valores>

```

// hacer siempre RESERVE
Una misma clave puede tener varios valores asociados

```

3.3.1 Ejemplo básico

```

multimap<int, string> mm;
// insertar pares (clave, valor)
mm.insert({1, "uva"});
mm.insert({2, "manzana"});
mm.insert({2, "pera"});
mm.insert({3, "melon"});

// Iterar (se imprime ordenado por clave)
for (auto &p : mm)
    cout << p.first << " -> " << p.second << "\n";
/*
1 -> uva
2 -> manzana
2 -> pera

```

3.3.3 Delete

```

mm.erase(2); // borra *todas* las entradas con clave=2
// Si quieres borrar solo uno:
auto it = mm.find(2);
if (it != mm.end())
    mm.erase(it);

```

3.4 Union find - cpbook

Cada que unimos dos Sets del mismo RANK(rank=r=altura - size=s=vertices) nuestro rank aumenta en +1. Entonces para formar un RANK r se necesitan por lo menos 2^r vertices.

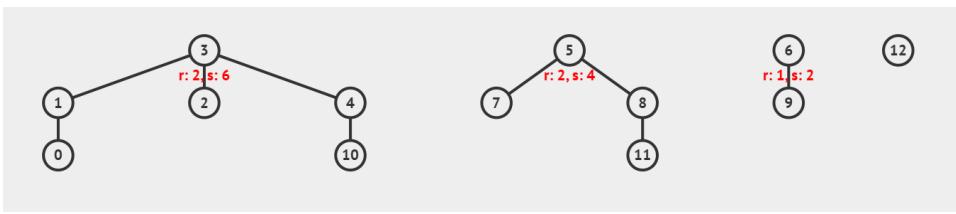

Figure 1: Inicializacion de Union-Find. Cada nodo es su propio padre.

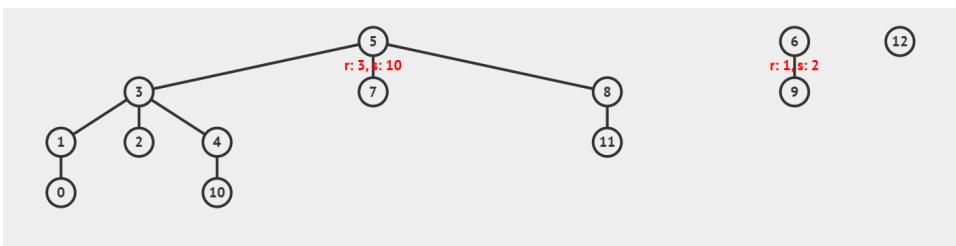

Figure 2: Union-Find despues de unir 3 y 5

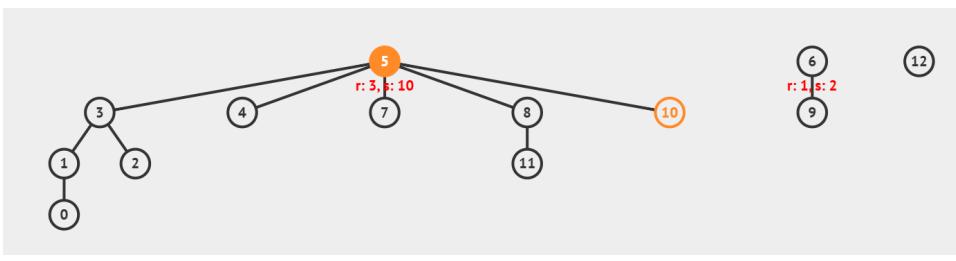

Figure 3: Union-Find despues findSet(10) con Path Compression

```
// Union-Find Disjoint Sets Library written in OOP manner
// using both path compression and union by rank
// heuristics

#include <bits/stdc++.h>
using namespace std;

typedef vector<int> vi;
```

```
class UnionFind { // OOP
    style
private:

Q(12) = 144
Q(13) = 169
Q(14) = 196
Q(15) = 225
Q(16) = 256
Q(17) = 289
Q(18) = 324
Q(19) = 361
Q(20) = 400
```

4.6 Simple Sieve of Eratosthenes $O(n*\log(\log(n)))$ - con n=1e7 1.25 MB

```
#define tam 1e7
vector <bool> criba(tam , true);
```

```
void criba_function()
{
    criba[0]=false;
    criba[1]=false;
    // ( i*i < tam) equivalente a ( i <= sqrt(tam))
    for(int i = 2; i*i <= tam ; i++)
    {
        if(!criba[i]) continue;
        for(int j = 2; i*j <= tam ; j++)
            criba[i * j] = false;
    }
}
```

4.7 Smallest Prime Factor AND Sieve of Eratosthenes $O(n)$ - con n=1e7 45 MB

```
// O(n)
// pr contains prime numbers
// lp[i] == i if i is prime
// else lp[i] is minimum prime factor of i
const int nax = 1e7;
int lp[nax+1]; //because lp is an array nax have to be
                less than 1e7 or change to a vector(nax+1,0)
vector<int> pr; // It can be sped up if change for an
array

void sieve(){
    for(i,2,nax){
        if (lp[i] == 0) {
            lp[i] = i; pr.pb(i);
        }
        for (int j=0, mult= i*pr[j]; j<sz(pr) && pr[j]<=lp[i]
             && mult<nax; ++j, mult= i*pr[j])
            lp[mult] = pr[j];
    }
}
```

4.8 Smallest Prime Factor Piton++

```
// O(n)
// pr contains prime numbers
// lp[i] == i if i is prime
// else lp[i] is minimum prime factor of i
const int nax = 1e7;
int lp[nax+1]; //because lp is an array nax have to be
                less than 1e7 or change to a vector(nax+1,0)
vector<int> pr; // It can be sped up if change for an
array

void sieve(){
    for(i,2,nax){
        if (lp[i] == 0) {
```

```

    lp[i] = i; pr.pb(i);
}
for (int j=0, mult= i*pr[j]; j<sz(pr) && pr[j]<=lp[i]
    && mult<nax; ++j, mult= i*pr[j])
    lp[mult] = pr[j];
}

```

4.9 Combinatorics

4.9.1 Next permutation

```

int main() {
    vector<int> perm = {1, 2, 3};
    sort(perm.begin(), perm.end());
    do {
        for (int x : perm)
            cout << x << ',';
        cout << '\n';
    } while (next_permutation(perm.begin(), perm.end()));

    int arr[] = {2,3,4,5,1,0};
    sort(arr, arr+6); // arr+CANTIDAD DE ELEMENTOS
    do
    {
        for (int x : perm)
            cout << x << ',';
        cout << '\n';
    } while (next_permutation(arr, arr+6));
    return 0;
}

```

5 Dynamic Programming

6 Otros

6.1 Binary Search

```

vi acu(int(1e5));
int c(int l, int r)
{
    if(l > 0) return acu[r] - acu[l-1];
    return acu[r];
}

int t;
int bs(int l, int r)
{
    int i = l, j = r;
    int n, mitad;

```

```

while (i != j)
{
    n = j - i;
    mitad = i + n/2;
    if(c(l,mitad) == t) return mitad - 1 + 1;
    if(c(l,mitad) > t) j = mitad;
    else i = mitad + 1;
}
return c(l,i) <= t ? i - l + 1 : (c(l,i - 1) ? i - l :
- 1);
}

int main() {
ios::sync_with_stdio(0);
cin.tie(0);
cout.tie(0);

icin(n)
cin >> t;
vi nums(n);
form(i,0,n) cin >> nums[i];

acu[0] = nums[0];
form(i,1,n) acu[i] = acu[i-1] + nums[i];
int maxi = 0;
form(i,0,n)
    maxi = max(maxi , bs(i, n-1));
cout << maxi << endl;
return 0;
}

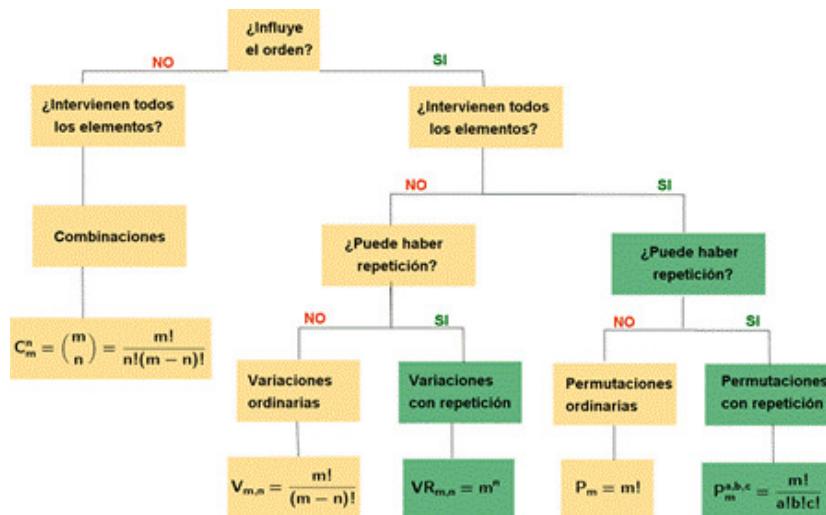

Figure 10: Combinatorics

The following are true involving modular arithmetic:

- $$(a + b) \% m = ((a \% m) + (b \% m)) \% m$$

Example: $(15 + 29) \% 8$
 $= ((15 \% 8) + (29 \% 8)) \% 8 = (7 + 5) \% 8 = 4$
 - $$(a - b) \% m = ((a \% m) - (b \% m)) \% m$$

Example: $(37 - 15) \% 6$
 $= ((37 \% 6) - (15 \% 6)) \% 6 = (1 - 3) \% 6 = -2 \text{ or } 4$
 - $$(a \times b) \% m = ((a \% m) \times (b \% m)) \% m$$

Example: $(23 \times 12) \% 5$
 $= ((23 \% 5) \times (12 \% 5)) \% 5 = (3 \times 2) \% 5 = 1$
